A tensile stress of 1000N is combined with a compressive stress of 2000N. The resultant is a compressive stress of 1000N.

2. Combining Bending and Tension Stresses

When a beam is bent it produces tension and compressive stresses along the axis of the beam. These axial stresses can be algebraically added to other tension and compression stresses acting along the axis of the beam.

combined bending, direct and torsional stresses in shafts

Cases arise such as in propeller shafts of ships where a shaft is subjected to direct thrust in addition to bending moment and torsion. In such cases the direct stresses due to bending moment and the axial thrust have to be combined into a single resultant.
