Abstract. This study reports on the dynamics of droplets in the capillary regime induced by electrowetting-on-dielectric actuation. The configuration investigated allows for comparing the experimental results with respect to the predictions of Brochard's theoretical model (Brochard in Langmuir 5:432-438, 1989).

Up to three times larger PA signals - compared to PA signals from thermal expansion - were continually observed by repeated vaporization and recondensation processes of droplets 0.2-1.0 μm in diameter. However, the underlying mechanism of the ODV has not been fully unveiled due to the complexity and involvement of various parameters in these studies. Lajoie
