Fluid dynamics. In physics and engineering, fluid dynamics is a subdiscipline of fluid mechanics that describes the flow of fluids (liquids and gases). It has several subdisciplines, including aerodynamics (the study of air and other gases in motion) and hydrodynamics (the study of liquids in motion).

Fluid Dynamics Basics - TeachEngineering

A very important equation in fluid dynamics is the Bernoulli equation. This equation has four variables: This equation has four variables: velocity ( $v$ ), elevation ( $h$ ), pressure ( $P$ ), and density ( $\rho$ ).

**Volume flow rate and equation of continuity (video) | Khan ...**

Sal introduces the notion of moving fluids and laminar flow. Then he uses the incompressibility of a liquid to show that the volume flow rate (flux) must remain constant. Sal then derives the equation of continuity in terms of the area and speed.

**Physics - Focus: Fluid Jet Acquires Wings**

Spreading wings. A jet of viscoelastic fluid (polyethylene glycol) forms wings when it impacts a glass plate. The fluid flows more slowly through the wings, which generates a polygon, rather than a circle for the flat sheet of fluid around the impact point.

**Jet (fluid) - Wikipedia**

A jet is a stream of fluid that is projected into a surrounding medium, usually from some kind of a nozzle, aperture or orifice. Jets can travel long distances without dissipating. Jet fluid has higher momentum compared to the surrounding fluid medium.

**Computational fluid dynamics modelling of gas jets ...**

Gas jets impinging onto a gas liquid interface of a liquid pool are studied using computational fluid dynamics modelling, which aims to obtain a better understanding of the behaviour of the gas jets used metallurgical engineering industry.
