Gene therapy is a promising new technique for treating many serious incurable diseases, such as cancer and genetic disorders. The main problem limiting the application of this strategy in vivo is the difficulty of transporting large, fragile and negatively charged molecules like DNA into the nucleus of the cell without degradation.

Another means of using bacteria for gene therapy is the so-called Alternative gene therapy (AGT) approach, which is also known as bacterial protein delivery. It is based on the transfer of bacterially expressed therapeutic proteins to the host organism using genetically modified (transformed) bacteria. As with bactofection, AGT is mostly used for treatment of tumors and employs primarily (PDF) [Delivery systems for gene therapy - ResearchGate](#)
