Thus, the evolution and migration of human beings can be traced by verifying the rate of conversion of the DNA genome sequences. For example, this theory attributes the origin of present day humans to Africa. The period over which these mutations occurred in the studied species dates back to the original sequence to a time that indicates early African civilization. If the multi-regional aspect is taken into consideration, humans are said to have evolved from Homo Erectus.

Initial studies of DNA from the mitochondria of Neanderthals showed that their mitochondrial DNA looks quite different to that of modern humans, suggesting that Homo neanderthalis and Homo sapiens did not interbreed.

Mitochondrial DNA Clarifies Human Evolution

Mitochondrial DNA -- maternal DNA -- is used to construct evolutionary trees. Mitochondrial DNA is present inside the nucleus of every cell of our body but it is the DNA of the cell's mitochondria that has been most commonly used to construct evolutionary trees.

Mitochondria have their own genome of about 16,500 bp that exists outside of the
