Abstract: A family of hypersurfaces evolves by mean curvature flow if the velocity at each point is given by the mean curvature vector. Mean curvature flow is the most natural evolution equation in extrinsic geometry, and has been extensively studied ever since the pioneering work of Brakke and Huisken.
[Introduction to Mean Curvature Flow \(Fall 2017\)](#)
Mean curvature flow is the most natural evolution equation in extrinsic geometry, and shares many features with Hamilton's Ricci flow from intrinsic geometry. Mean curvature flow and its variants have some striking applications in geometry, topology, material science, image processing and general relativity. In this course we will provide a general introduction to mean curvature flow and its applications. In the first half of the course we will focus on the evolution up to the first singular
