The three-dimensional arrangement of atoms and molecules in crystals and the comparable magnitude of x-ray wavelengths and interatomic distances make it possible for crystals to have more than one set of atomic planes that satisfy Bragg's law and simultaneously diffract an incident x-ray beam - this is the so-called multiple diffraction.

Diffraction of X-rays by Crystals. X-rays are electromagnetic radiation of high penetrating power and short wavelength, which are emitted from a target when it is bombarded with high-energy electrons as illustrated in Figure 1.

Diffraction of x-rays by crystals In principle, the wavelength of any electromagnetic wave can be determined if a grating of the proper spacing (of the order of  $\lambda$ ) is available. X-rays, discovered by Wilhelm Roentgen (1845-1923) in 1895, are electromagnetic waves of very short wavelength (of the order of 0.1 nm).
