Scattering phenomena: classical theory In classical mechanics, for a central potential, $V(r)$, the angle of scattering is determined by impact parameter $b(\theta)$. The number of particles scattered per unit time between θ and $\theta + d\theta$ is equal to the number incident particles per unit time between b and $b + db$. Therefore, for incident $u(x, y, z, t)$, the number

Max Born 21 July 1926 Abstract The Schrödinger form of

Quantum Mechanics permits one to define in a natural way the frequency of occurrence of a state with help of the intensity of the associated eigenfunction. This

[Many-body problem - Wikipedia](#)

The many-body problem is a general name for a vast

category of physical problems pertaining to the properties of microscopic systems made of a large number of

interacting particles. Microscopic here implies that

quantum mechanics has to be used to provide an accurate

description of the system.
